Today's Content - Data Manipulation Language

Data Manipulation Language

- Insert statement
- Select Statement
- Update Statement
- Where clause
- > FUNCTIONS

Insert Statement syntax

- It is possible to write the INSERT INTO statement in two forms.
- The first form does not specify the column names where the data will be inserted, only their values:
- INSERT INTO table_name VALUES(value1, value2, value3,...);
- The second form specifies both the column names and the values to be inserted:
- INSERT INTO table_name (column1,column2,column3,...)
 VALUES (value1,value2,value3,...);

Insert Statement: Examples

Example one: Inserting one record in a table using the first syntax; INSERT INTO table_name VALUES value1, value2, value3,...);

Example two: Inserting multiple records in a table using the

```
mysql) insert into students (student_id,firstname,lastname,age) values("","Orena","Ian",19),
-> ("","Namugera","Victoro",12);
Query OK, 2 rows affected, 2 warnings (0.13 sec)
Records: 2 Duplicates: 0 Warnings: 2
```

Insert Statement: Examples

>Example 3: Inserting three records

Example 4. How to insert values on an auto increment Field

```
mysql> insert into attendance (date) values (2013090908096);
Query OK, 1 row affected, 1 warning (0.00 sec)
```

Insert Statement: Examples

Example 5: Inserting records with Foreign keys, you have to first insert data in the reference tables

```
mysql> insert into lecturer values (1,"Richard","Kimera","Male","1980-09-07","rkimera@mus
t.ac.ug",2,1),(2,"Richard","Kalungi","Male","1988-08-03","kaldixo@must.ac.ug",1,1);
Query OK, 2 rows affected, 2 warnings (0.02 sec)
Records: 2 Duplicates: 0 Warnings: 2
```

- ➤ Basing on our database structure, information is to be stored in the format
 - First insert in all the following tables attendance, location, course_studied and course_unit
 - Next insert in the lecturer table and lastly student table

Select Statement syntax

SELECT [DISTINCT] column_list

FROM table_list

[WHEREconditions]

[GROUPBYgroup[HAVINGgroup_conditions]]

[ORDERBYsort_columns]

[LIMIT [beginning_row,]number_retrieved];

Select Statement syntax

Selecting all records from a table;

Select specific records from a table

Select Distinct

- ➤ In a table, some of the columns may contain duplicate values. This is not a problem, however, sometimes you will want to list only the different (distinct) values in a table.
- The DISTINCT keyword can be used to return only distinct (different) values.
- ➤ SQL SELECT DISTINCT Syntax
 - > SELECT DISTINCT column_name(s) FROM table_name;

Select Distinct Multiple-Columns

SUCCEED WE MUST

```
mysql> select distinct firstname, lastname from students;
  firstname l
              lastname
  Agaba
                Edith
                Samson
  Ampaire
  Kamoga
                Mahadi
                Geraldine
  Ampaire
  Bwamiki
               Isaac
 Orena
               Ian
 Namugera
               Victoro
 rows in set (0.00 sec)
```

- The where clause is used to specify a criteria
- >Syntax: SELECT column_name(s) FROM table_name WHERE column_name operator value

Operator	Description
=	Equal
<>	Not equal
>	Greater than
<	Less than
>=	Greater than or equal
<=	Less than or equal
BETWEEN	Between an inclusive range
LIKE	Search for a pattern
IN	To specify multiple possible values for a column

Example with the Where clause

```
mysql> select firstname,lastname from students where student_id=2;
              lastname
 firstname
               Samson
 Ampaire
1 row in set (0.00 sec)
mysql> select firstname,lastname from students where student_id<>2;
 firstname
              lastname
  Agaba
               Edith
               Mahadi
 Kamoga
               Geraldine
              Isaac
 Bwamiki
 Orena
              lan
 Namugera
              Victoro
6 rows in set (0.00 sec)
mysql> select student_id,firstname,lastname from students where student_id<>2;
 student_id | firstname |
                           lastname
                             Edith
               Agaba
                             Mahadi
               Kamoga
                             Geraldine
               Ampaire
               Bwamiki
                            Isaac
               Orena
                            Ian
               Namugera
                            Victoro
6 rows in set
```

More Example

```
mysql> select student_id,firstname,lastname from students where student_id>=2;
 student_id | firstname |
                            Samson
               Ampaire
               Kamoga
                            Geraldine
              Ampaire
               Bwamiki
                           Isaac
               Orena
                           Ian
               Namugera
                           Victoro
6 rows in set (0.00 sec)
```

The Logical Operators OR, AND and NOT

Logical	Description
Operators	
OR	For the row to be selected at least one of the conditions must be true.
AND	For a row to be selected all the specified conditions must be true.
NOT	For a row to be selected the specified condition must be false.

The SQL AND, OR and NOT Operators

- ➤ The WHERE clause can be combined with AND, OR, and NOT operators.
- The AND and OR operators are used to filter records based on more than one condition:
- The AND operator displays a record if all the conditions separated by AND are TRUE.
- The OR operator displays a record if any of the conditions separated by OR is TRUE.
- The NOT operator displays a record if the condition(s) are NOT TRUE.

The AND operator

- ➤The AND operator are used to filter records based on more than one condition:
- Returns all records which have certain names. AND is used if both sides of the where clause are to hold true

Example Two with the AND operator

SQL Where clause - BETWEEN

➤ BETWEEN is used to specify a range

```
mysql> select student_id, firstname, lastname from students where student_id between 2 and 4;
student_id | firstname | lastname
           2 | Ampaire
3 | Kamoga
4 | Ampaire
               Ampaire
3 rows in set (0.13 sec)
```

The logical operator, OR

- ➤The OR operator displays a record if any of the conditions separated by OR is TRUE.
- ➤So If you want to select rows that satisfy at least one of the given conditions, you can use the logical operator, OR.
- ➤ Example

The NOT operator

- ➤ If you want to find rows that do not satisfy a condition, you can use the logical operator, NOT.
- That is, if a condition is satisfied, then the row is not returned.

```
mysql> select firstname,lastname from students where Not firstname="Kamoga";
 Ampaire
```

- The LIKE operator is used to list all rows in a table whose column values match a specified pattern.
- ➤ It is useful when you want to search rows to match a specific pattern, or when you do not know the entire value. For this purpose we use a wildcard character '%'.
- The % operator can be used to specify wildcards (matches one or more characters in a pattern) both before and after the pattern.
- ➤ The _ operator can be used also to specify wildcards(matches one character.
- ➤ The like operator is used to search for specified format of information.

SQL Where clause - LIKE

- ➤ Syntax: SELECT column_name(s) FROM table_name WHERE column_name LIKE pattern
- **EXAMPLES:** Select all first names that start with **letter A**

EXAMPLES: Select all first names that start with letter T

EXAMPLES: Select all first names that start with **letter T**

SQL Where clause - LIKE

EXAMPLES: Select all first names that End with **letter O**

```
mysql> select fname from students where fname LIKE '%o';
 fname :
 Abaho ¦
 Abaho 1
 rows in set (0.00 sec)
```

Where clause - LIKE

EXAMPLES: Select all first names that Start with letter **A** and End with **letter O**

```
mysql> select fname from students where fname LIKE 'A_%o';
¦fname¦
¦ Abaho ¦
¦ Abaho ¦
2 rows in set (0.00 sec)
```

Where Clause and the IN operator

- The IN operator allows you to specify multiple values in a WHERE clause.
- ➤ Syntax: SELECT column_name(s) FROM table_name WHERE column_name IN (value1,value2,...)
- >Example 1

```
mysql> select fname,lname from students where lname IN('Ivan','Job');

+-----+

| fname | lname |

+----+

| Epou | Ivan |

| Chebet | Job |

+----+

2 rows in set (0.00 sec)
```

Example 2 with The IN-operator

```
mysql> select firstname from students where firstname IN("nabimanya","Ndagire");
| firstname
Nabimanya
Ndagire
2 rows in set (0.04 sec)
mysql> select firstname,lastname from students where firstname IN("nabimanya","Ndagire");
| firstname | lastname
Nabimanya | Arnold
Ndagire
           | Mariat
2 rows in set (0.00 sec)
```

Where Clause: IN operator and LIMIT clause

- The LIMIT clause can request the **first "n" rows**, the first row is **zero**, not **one** WHERE and ORDER BY clauses happen *before* the LIMIT is applied.
- ➤ The LIMIT clause can request the **first "n" rows**, the first row is **zero**, not **one** WHERE and ORDER BY clauses happen *before* the LIMIT is applied

```
mysql> select firstname,lastname from students where firstname IN("nabimanya","Ndagire") limit 1;
| firstname | lastname
| Nabimanya | Arnold
1 row in set (0,00 sec)
mysql> select firstname,lastname from students where firstname IN("nabimanya","Ndagire") limit 2;
| firstname |
             lastname
             Arnold
Nabimanya
Ndagire
             Mariat
2 rows in set (0.00 sec)
```

Order by Clause

- SUCCEED WE MUST
 - ➤ Order by is used to sort information in a table, it could be either in Ascending (ASC) order or descending (DESC) order.
 - ➤An example

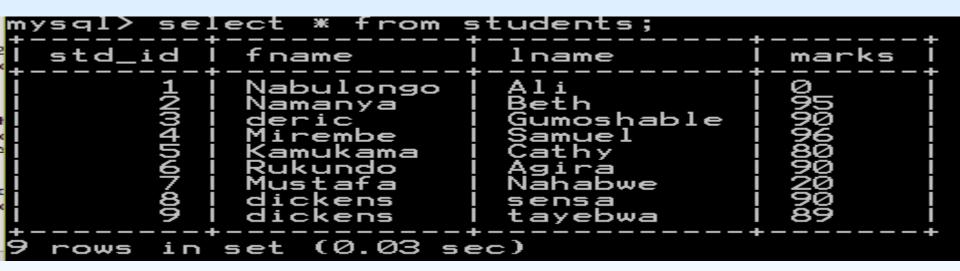

```
mysql> select fname,lname from students order by lname DESC;
               1name
  fname
 Nuwagaba
              Ronald
 Ayebare
              Prossy
 Abaho
              Patience
 Ayebare
              Merab
  Tebandeke
              Lawrence
 Chebet
              Job
  Epou
              Joan
  Epou
               Ivan
  Nīnsiima
               Eunice
  Abaho
               Dickson
  rows in set (0.00 sec)
mysql> select fname,lname from students order by fname desc;
  fname
               1name
 Tebandeke
              Lawrence
 Nuwagaba
              Ronald
  Ninsiima
              Eunice
  Epou
              Joan
  Epou
               Ivan
              Job
  Chebet
 Avebare
              Prossy
 Avebare
  Abaho
  rows in set (0.00 sec)
```

Update Statement syntax

- There may be a requirement where the existing data in a MySQL table needs to be modified. You can do so by using the SQL **UPDATE** command. This will modify any field value of any MySQL table.
- ➤SYNTAX: UPDATE SET <attribute> = <expression> WHERE <condition>;
- **Example 1.** Changing the first and last names of a specific record

Table students Before updating it

Example 1. Changing the first, last names and Marks of a specific record

Table students Before updating it

➤ Table students After updating it

Update Statement syntax

- ➤ MySQL also has a REPLACE command that can either update an old record or insert a new one, depending on whether the record exists already. The form is similar to the INSERT form.
- ➤ REPLACE INTO tablename(colnames) VALUES (column_values);

- Functions make the basic query far more powerful and are used to:
 - Perform calculations on data
 - –Modify data items
 - -Manipulate output for rows
 - Alter date formats for display
 - Convert column data types

SQL aggregate functions return a single value, calculated from values in a column. Some of these functions include

- ➤ AVG() Returns the average value
- ➤ COUNT() Returns the number of rows
- FIRST() Returns the first value
- ➤LAST() Returns the last value

- ➤MAX() Returns the largest value
- ➤MIN() Returns the smallest value
- >SUM() Returns the sum

- ➤ SQL scalar functions return a single value, based on the input value. Some of these include:
- ➤ UCASE() Converts a field to upper case
- >LCASE() Converts a field to lower case
- MID() Extract characters from a text field
- LEN() Returns the length of a text field
- ROUND() Rounds a numeric field to the number of decimals specified
- ➤NOW() Returns the current system date and time
- FORMAT() Formats how a field is to be displayed

Aggregate Functions: Examples

➤ Syntax for average: SELECT AVG(column_name) FROM table_name

```
mysql> select * from course_unit;
 idcourse | Name
                            | time
                                     | Final_Mark
       1 | Database Programming | 09:00:10 | 78
       2 | Computer Programming | 09:00:00 | 78
2 rows in set (0.00 sec)
avg(Final_Mark)
 row in set (0.04 sec)
```

```
mysql> select * from students;
                         lname
  std_id | fname
                                        marks
            Amai
                        Clovis
                                        69
99
99
99
99
99
99
99
            Namanya
                         Gumoshable
                         Samuel
                        tayebwa
 rows in set (0.00 sec)
mysql> select avg(marks) from students;
  avg(marks)
  79.888888888888
  row in set (0.10 sec)
```

Using Round and Avg

The ROUND() function returns a number rounded to a certain number of decimal places.

counting Functions: Examples

```
mysql> select count(fname) from students;
 count (fname)
 row in set (0.00 sec)
mysql> select * from students;
 std_id | fname | <u>| lname</u>
                                      marks
                        Clovis
            Amai
       N3456789
            Namanya
                        Beth
                        Gumoshable
            deric
            Mirembe
                        Samuel
            Kamukama
                        Cathy
            Rukundo
                        Agira
            Mustafa
                        Nahabwe
            dickens
                        sensa
           dickens
                        tayebwa
      in set (0.00 sec)
  rows
```

counting Functions: Examples

➤ Selecting all values from table students

```
mysql> select * from students;

| std_id | fname | lname | marks |
| 1 | Amai | Clovis | 69 |
| 2 | Namanya | Beth | 95 |
| 3 | deric | Gumoshable | 90 |
| 4 | Mirembe | Samuel | 96 |
| 5 | Kamukama | Cathy | 80 |
| 6 | Rukundo | Agira | 90 |
| 7 | Mustafa | Nahabwe | 20 |
| 8 | dickens | sensa | 90 |
| 9 | dickens | tayebwa | 89 |
| 7 | rows in set (0.00 sec)
```

counting distinct fname from a students above

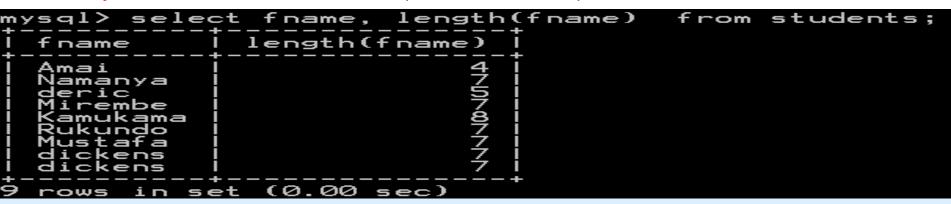

Creating a new column for a given result set

The LENGTH() Function

- ➤ The LENGTH() function returns the length of the value in a text field.
- Syntax: SELECT LENGTH(column_name) FROM table_name;

Find the Length of two Columns Combined

Using Max and LENGTH() Functions

- ➤ Using Max and Length () functions will give you the longest record that is specified in your SQL statement.
- ➤ Example below

The FORMAT() Function

- The FORMAT() function is used to format how a field is to be displayed.
- Syntax: SELECT FORMAT(column_name,format) FROM table_name;
- column_name The field to be formatted.
- Format Specifies the format.
